Abstracts

Ultrasound biometry devices are medical instruments that utilize high-frequency sound waves to measure anatomical structures, primarily within ophthalmology for determining axial eye length, anterior chamber depth, lens thickness, and corneal curvature, which are critical parameters for calculating intraocular lens power in cataract surgery and monitoring myopia progression. These devices operate on the principle of A-scan ultrasound, providing precise biometric data through either contact methods, where a probe touches the cornea with local anesthesia, or immersion techniques, which use a fluid-filled shell for enhanced accuracy by avoiding corneal compression. Advancements have integrated these systems with optical biometry tools like partial coherence interferometry, offering non-contact alternatives, yet ultrasound biometry remains widely valued for its reliability, cost-effectiveness, and utility in cases where optical methods are unsuitable, such as with dense cataracts or corneal opacities. The core function centers on generating accurate, reproducible measurements to support surgical planning and diagnostic assessments in eye care.

The global Ultrasound Biometry Devices market size was estimated at USD 210.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
