Abstracts

Ultrasound bone stimulators are non-invasive medical devices that utilize low-intensity pulsed ultrasound (LIPUS) to accelerate the healing process in fresh fractures, nonunions, and stress injuries by stimulating cellular activity at the fracture site. These devices transmit high-frequency sound waves into bone tissue, which trigger biochemical responses in osteoblasts and chondrocytes, promoting angiogenesis, increasing calcium uptake, and enhancing callus formation. They are typically used as an adjunct to standard care?such as casting or bracing?in cases where delayed healing is observed or in high-risk patient populations, offering a non-pharmacological alternative to surgical interventions like bone grafting or internal fixation.

The global Ultrasound Bone Stimulators market size was estimated at USD 325.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
