Report Overview

Nerve block is a kind of injection that blocks the conduction of nerve function, which is a kind of closed needle. This medical technology is mainly used to block the vicious cycle of pain, improve blood circulation, etc., and is commonly used in clinical practice. Nerve block needles usually inject anesthetic drugs around nerve trunks, plexuses, nodes, etc. to block the connection with the pain nerves of the brain, anesthetize the innervated area, and paralyze the nerves. Nerve block needles can not only block sensory nerves, but also relieve muscle spasms caused by pain and improve local vicious circles. For some patients with local diffuse congestion and edema, injection of nerve block needles can also be used to eliminate the edema and promote the absorption of inflammation. Nerve block needles are mainly aimed at pathological nerve damage, and transient neurological function loss and numbness and tingling will occur after injection. However, compared with other analgesic techniques, nerve block has better analgesia, higher safety, fewer side effects, and faster postoperative recovery. When injecting nerve block needles, there are also certain requirements for the doctor's technical operation.
