Abstracts

Ultrasound therapy devices are non-invasive medical instruments that utilize high-frequency sound waves (typically between 1-3 MHz) to generate thermal and mechanical effects in targeted tissues for therapeutic purposes, primarily applied in physical therapy, sports medicine, and rehabilitation settings to reduce pain, decrease inflammation, promote tissue healing, and enhance mobility by stimulating cellular activity and increasing blood flow to injured areas. These devices are categorized as either continuous or pulsed wave modalities, with the latter being more common for acute conditions to minimize thermal buildup, and they are regulated as medical devices in most markets, requiring compliance with specific safety and efficacy standards such as FDA clearance in the United States or CE marking in the European Union.

The global Ultrasound Therapy Device market size was estimated at USD 350.68 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
