## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ultraviolet Lamp (UV Lamp) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An Ultraviolet Lamp (UV lamp) is a light source that emits ultraviolet radiation, commonly used in various fields such as disinfection, medical treatments, industrial applications, and scientific research. Ultraviolet light is an electromagnetic wave with wavelengths between visible light and X-rays, divided into three types: UVA, UVB, and UVC. Among these, UVC has the strongest sterilizing effect and is widely used in water treatment, air purification, and surface disinfection. The working principle of ultraviolet lamps is based on passing current through gas or special chemicals to produce ultraviolet radiation. These lamps typically use mercury vapor or xenon gas as a discharge source to generate ultraviolet light. Depending on their purpose, ultraviolet lamps can be classified into low-pressure UV lamps, high-pressure UV lamps, and low-temperature UV lamps. Applications include air purifiers, drinking water treatment systems, food production lines, skin disease treatment, and laboratory sterilization equipment. Due to their high efficiency and energy-saving characteristics, ultraviolet lamps are gradually replacing traditional chemical disinfection methods, especially in public health and environmental protection. However, ultraviolet radiation can also pose risks to human health, causing skin burns or eye damage if overexposed, making it crucial to follow safety standards during use. UV Lamp is a device that achieves specific functions by emitting ultraviolet (UV) spectrum. It is mainly divided into three categories: UVA, UVB and UVC. It is widely used in sterilization, industrial curing, medical treatment, printing and environmental purification. At present, its development shows a significant trend of technological iteration and market expansion: at the technical level, traditional mercury lamps are gradually being replaced by environmentally friendly and efficient UV LEDs

due to their toxic substances and high energy consumption. The latter, with its advantages of precise controllable wavelength, instant opening and closing, and long life, promotes the rapid penetration of deep ultraviolet (UVC LED) technology in portable disinfection equipment, water treatment and other scenarios; in terms of market demand, the improvement of public health awareness after the COVID-19 pandemic has accelerated the popularization of UV disinfection products, while the demand for UV curing processes in industries such as semiconductors and display panels continues to grow; in terms of policy drive, the global "Minamata Convention"'s restrictions on mercury products further forced the industry to transform, but UV LED still faces technical bottlenecks and cost pressures such as low chip efficiency and difficult heat dissipation. In the future, with breakthroughs in materials science and large-scale production and cost reduction, UV Lamp will expand a wider range of application scenarios in smart homes, biomedicine, green manufacturing and other fields.

The global Ultraviolet Lamp (UV Lamp) market size was estimated at USD 566.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
