Report Overview

The ultraviolet light-curable paint is automatically roller-coated and shower-coated on the surface of the object by machinery and equipment. Under the irradiation of ultraviolet light, the initiator is decomposed to generate free radicals, which triggers the resin reaction and instantly solidifies to form a film. The ultraviolet light-curable paint is generally composed of UV curable resin (main resin), photoinitiator (photosensitizer), pigments and fillers and additives. As a material used to paint and form a coating film on the surface of an object, the ultraviolet light-curable paint has protection, decoration or special functions (insulation, rust prevention, mildew resistance, heat resistance, etc).
