Abstracts

Ultraviolet optical glass refers to a specialized class of optical materials engineered to transmit ultraviolet (UV) light with high efficiency, typically within the wavelength range of 200-400 nanometers, while exhibiting minimal absorption, scattering, and fluorescence. These glasses are formulated with specific compositions, often incorporating high-purity silica, fused quartz, or doped materials like calcium fluoride, to achieve desired optical properties, including high UV transmittance, low thermal expansion, and resistance to solarization or darkening under prolonged UV exposure. They are distinct from conventional optical glasses, which are optimized for visible light transmission, and are critical in applications requiring precise UV light management, such as lithography, spectroscopy, medical devices, and scientific instrumentation.

The global Ultraviolet Optical Glass market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
