Abstracts

Ultraviolet vein finders are medical devices that utilize near-infrared light technology combined with digital imaging to project a real-time map of subcutaneous veins onto the skin's surface, enhancing visibility for healthcare professionals during procedures such as venipuncture, intravenous cannulation, or blood draws. These devices improve procedural accuracy by reducing the need for multiple needle insertion attempts, thereby increasing patient comfort, minimizing complications like hematoma formation, and saving time in clinical settings. They are particularly valuable for patients with difficult venous access, such as pediatric, geriatric, obese, or critically ill individuals, and are used across various healthcare environments including hospitals, clinics, and emergency care units.
