Abstracts

Umbilical hernia prostheses are medical devices, typically composed of biocompatible synthetic mesh materials such as polypropylene or polyester, designed to surgically repair defects in the abdominal wall at the umbilical site. These prostheses provide mechanical reinforcement to weakened tissues, promoting tissue ingrowth and reducing the risk of hernia recurrence by distributing abdominal pressure more evenly. Available in various shapes, sizes, and configurations?including flat sheets, preformed three-dimensional constructs, and lightweight or composite meshes?they are engineered to minimize complications such as infection, adhesion formation, and patient discomfort. The selection of a specific prosthesis depends on factors like hernia size, patient anatomy, surgical approach (open or laparoscopic), and surgeon preference, with innovations increasingly focusing on improved biocompatibility, resorbability, and integration with minimally invasive techniques.

The global Umbilical Hernia Prosthesis market size was estimated at USD 125.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
