## Abstracts

The umbrella IVC filter is an early design type of inferior vena cava filter. The umbrella IVC filter is a medical device specially designed to prevent pulmonary embolism (PE) caused by the detachment of emboli in the inferior vena cava (IVC) system. It is usually implanted in the inferior vena cava to capture and block thrombi or other emboli that may detach and flow to the lungs. The first filter used in clinical practice was the Mobin-Uddin umbrella filter system launched in 1967, which required venous incision. After years of continuous improvement, the variety of filters has increased, the filtration effect has improved, and the incidence of pulmonary embolism has been significantly reduced.

The global Umbrella-shaped IVC Filter market size was estimated at USD 328.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
