Report Overview

An unabsorbable suture is a type of surgical suture material that is not absorbed by the body over time. It is primarily composed of non-biodegradable materials such as polyester, polypropylene, or silk. These sutures are designed to provide long-term support and stability in various medical procedures, particularly in areas where high tensile strength is required, such as in orthopedic surgeries, hernia repairs, and some cardiovascular procedures. Unabsorbable sutures maintain their integrity indefinitely, allowing them to be removed only through surgical intervention if necessary. This characteristic makes them suitable for applications where permanent or long-lasting support is needed, and where the risk of suture material breaking down prematurely could lead to complications.
