Abstracts

An uncompensated pressure sensor is a fundamental pressure measurement device that directly translates pressure changes into an electrical signal without the benefit of built-in temperature compensation or calibration, resulting in a relatively low cost; this sensor relies on the deformation or capacitive change of its sensing element in response to pressure to produce an output signal proportional to the pressure, yet its output may be subject to inaccuracies due to environmental temperature variations, potentially leading to reduced measurement precision; lacking temperature compensation capabilities, the uncompensated pressure sensor may require additional corrective measures under conditions of significant temperature fluctuations to ensure the accuracy of readings, making it attractive in cost-sensitive applications where high precision is not a critical requirement.

The global Uncompensated Pressure Sensor market size was estimated at USD 376.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
