Abstracts

An uncoupled dual inductor is an electronic component consisting of two independent inductor coils housed within a single package but designed to operate without mutual magnetic coupling between them, meaning the magnetic field generated by one coil does not significantly influence the other. This isolation is achieved through physical separation, magnetic shielding, or specific core geometries that prevent flux linkage. Unlike coupled inductors, which are used in applications like transformers where energy transfer between windings is desired, uncoupled dual inductors are employed in circuits requiring minimal interference, such as in independent filtering stages, noise suppression in power supplies, or multi-channel signal processing where cross-talk must be avoided. They are valued for their space-saving design compared to using two discrete inductors while maintaining electrical independence, making them suitable for compact and high-density PCB layouts in consumer electronics, telecommunications, and automotive systems.

The global Uncoupled Dual Inductor market size was estimated at USD 85.43 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
