Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Under Bump Metallization (UBM) System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Under Bump Metallization (UBM) system is a multilayer metal thin-film structure formed between the chip's I/O pads and bumps (typically solder balls or copper pillars) in flip-chip packaging. Deposited through processes like sputtering or electroplating with metals such as Ti/Cu/Ni/Au, UBM ensures reliable interconnection between the chip and substrate via metallurgical reactions. It provides compatibility with bump materials (e.g., solder wettability), enhances pad adhesion and mechanical connection strength, prevents metal diffusion, formation of brittle intermetallic compounds, and silicon corrosion, while optimizing signal integrity and interconnection performance. As a uniform soldering interface and barrier layer, UBM improves assembly yield and long-term reliability, making it a critical technology in flip-chip packaging and wafer-level packaging (WLP) for high-performance chip manufacturing.

The global Under Bump Metallization (UBM) System market size was estimated at USD 271.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
