Abstracts

Undercast padding bandage, also known as orthopedic padding or cast padding, refers to a soft, fibrous material typically composed of cotton, polyester, or synthetic blends designed to be applied directly to the skin before the placement of a rigid cast or splint during fracture management and orthopedic treatments. Its primary functions include cushioning bony prominences and sensitive areas, absorbing moisture, distributing pressure evenly, and preventing skin irritation, abrasions, or sores caused by the hard outer shell. Additionally, it serves as a barrier to protect against thermal injury during the exothermic reaction of plaster cast setting and allows for breathability to maintain skin integrity throughout the healing period.

The global Undercast Padding Bandage market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
