Abstracts

An underslab vapor barrier is a continuous membrane installed beneath concrete slabs on grade to prevent moisture vapor transmission from the subsoil into the structure. These barriers are typically made from polyethylene, polyolefin, or other engineered polymers, with varying thicknesses and permeance ratings (measured in perms) to meet project-specific requirements. By blocking moisture ingress, they protect flooring materials, prevent mold growth, reduce humidity levels, and enhance indoor air quality, while also contributing to the long-term durability of the concrete slab by minimizing potential corrosion of embedded metals and chemical degradation.

The global Underslab Vapor Barriers market size was estimated at USD 545.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
