Abstracts

Underwater acoustic modems are specialized communication devices that transmit and receive digital data through water via acoustic signals, enabling wireless underwater networking for applications such as oceanographic research, offshore energy operations, environmental monitoring, and military and defense activities where traditional radio frequency or optical communication methods are ineffective due to water's high attenuation of electromagnetic waves. These modems convert electrical data into sound waves, which propagate through water over varying distances depending on frequency, power, and environmental conditions, and then decode received acoustic signals back into digital information, facilitating real-time data exchange between submerged instruments, autonomous underwater vehicles (AUVs), remotely operated vehicles (ROVs), and surface platforms or shore-based stations.

The global Underwater Acoustic Modems market size was estimated at USD 128.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
