Abstracts

Underwater Location Beacons (ULBs), also known as underwater locator beacons or pingers, are electronic devices attached to flight data recorders and cockpit voice recorders (commonly referred to as "black boxes") in aircraft, as well as marine vessels and other underwater assets, designed to emit an acoustic signal (typically at 37.5 kHz) upon immersion in water to assist in the detection and recovery of submerged equipment during search and rescue or investigation operations. These devices are activated either automatically by water contact or manually, and they transmit ultrasonic pulses at regular intervals to aid sonar systems in pinpointing their location, even in deep or turbid waters where visual searches are impractical, thereby playing a critical role in maritime and aviation safety by drastically reducing the time and resources required for underwater retrieval missions.

The global Underwater Location Beacon market size was estimated at USD 45.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
