Abstracts

Underwater photography lighting refers to the use of artificial light sources specifically designed for underwater photography. It is essential due to the rapid attenuation of natural light as it penetrates water. These lighting devices, such as strobes and video lights, are used to illuminate underwater subjects, enhance colors, and bring out details that would otherwise be lost in the low - light and color - distorting underwater environment. The lighting needs to be carefully controlled and adjusted according to factors like water depth, subject distance, and the desired aesthetic effect to produce clear, vibrant, and visually appealing underwater images and videos.

The global Underwater Photography Lighting market size was estimated at USD 2214.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
