## Abstracts

Underwater ship cleaning services refer to specialized maintenance operations that use professional divers or intelligent robotic systems to remove marine organisms such as algae and barnacles adhering to underwater parts of ships. This service primarily relies on core technologies such as high-pressure water jetting and cavitation jetting to complete cleaning directly underwater while the ship is anchored in port or harbor, eliminating the need for dry docking and significantly reducing economic losses caused by ship downtime. Its core value lies in effectively removing biofouling, reducing ship drag, thereby improving fuel efficiency, controlling operating costs, and helping the shipping industry meet increasingly stringent environmental regulations such as the Energy Efficiency Design Index (EEXI) and Carbon Intensity Index (CII). Currently, this service has formed a complete system covering biofouling assessment, cleaning inspection, operation execution, and acceptance standards, and is widely used for various ship types, including cargo ships, tankers, and research vessels. The underwater ship cleaning service market has broad prospects and strong growth momentum. This growth is mainly due to three factors: First, the International Maritime Organization (IMO) and the European Union have incorporated ship carbon emissions into their regulatory systems (such as the EU ETS), making hull cleaning a key path for shipping companies to comply with emission reduction regulations by reducing drag, fuel consumption, and emissions. Second, major global shipping companies such as Maersk and MSC have actively adopted robots for underwater hull cleaning to cope with operating cost pressures, shifting service demand from traditional periodic maintenance to high-frequency, high-efficiency routine operations. Finally, technological iteration is driving industry upgrades. Intelligent robots, with their cavitation jet technology, can achieve fine cleaning without damaging the ship's paint. Combined with real-time data collection and visualization platforms, they provide decision support for ship owners, prompting the service model to evolve from simple cleaning to an integrated "inspection-

cleaning-management" solution. In the future, with the completion of the ISO's unified international standard for underwater cleaning, robot cleaning services with environmentally friendly and energy-efficient characteristics will become more widespread and form a large-scale application market in shipping hubs such as the Asia-Pacific and Europe.

The global Underwater Ship Cleaning Services market size was estimated at USD 652.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
