A fish finder is an instrument used to locate fish underwater by detecting reflected pulses of sound energy, as in sonar. A modern fish finder displays measurements of reflected sound on a graphical display, allowing an operator to interpret information to locate schools of fish, underwater debris, and the bottom of body of water. Recreational fishing uses low-cost camera imaging fishfinders. Fish finder instruments are used both by sport and commercial fishermen. With the increasing exploration of underwater environments, the underwater video fish finder has become an indispensable tool in sectors such as the fishing industry and recreational angling. Equipped with high-definition cameras and sonar technology, the underwater video fish finder captures real-time underwater scenes and accurately detects the positions of fish schools. In the fishing industry, it provides fishermen with more effective means of catching fish, helping them reduce the cost of blind net casting, enhance fishing efficiency, and promote sustainable fishing practices. Additionally, for leisure anglers, the underwater video fish finder enables them to precisely locate active fish zones, thereby increasing the enjoyment and success rate of fishing.

The global Underwater Video Fish Finder market size was estimated at USD 181.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
