Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Unidirectional Plastic Geogrid competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Unidirectional Plastic Geogrid production reached approximately 85.38 million square meter, with an average global market price of around US\$ 2.1 per square meter. A unidirectional plastic geogrid is a planar mesh material formed by extruding and calendaring high molecular polymers such as high-density polyethylene (HDPE) or polypropylene (PP) into a high-strength plastic sheet, which is then uniaxially stretched (only in one direction? typically longitudinally) to create a regularly oriented porous structure. The molecular chains are highly oriented during stretching, resulting in high tensile strength and low elongation along the stretching direction (the primary load-bearing direction), while the strength perpendicular to the stretching direction remains relatively low. Surface embossing or roughening treatments enhance frictional interlocking with soil, sand, and other fillers, allowing the filler particles to embed into the grid pores and form a mechanical interlock effect. This enables the filler and geogrid to work synergistically to bear external loads, primarily improving the tensile strength, shear strength, and overall stability of the soil. It is widely used in civil engineering applications such as roadbeds, embankments, and slopes.

The global Unidirectional Plastic Geogrid market size was estimated at USD 179.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
