A single-polarization beamformer is a device or technology used in wireless communication systems that adjusts and combines the phase and amplitude of signals from one or more antenna arrays to generate a focused beam pointing in a specific direction. This technology focuses on a single polarization mode (such as horizontal polarization or vertical polarization) to improve the directivity and gain of the signal while reducing the impact of interference and noise. Single-polarization beamformers are widely used in radar systems, mobile communication base stations, and satellite communications, helping to enhance the quality and reliability of communication links, especially in complex environments or multi-user scenarios.
