Abstracts

Universal Hydraulic Jack is a kind of hydraulic jack that is suitable for various lifting operations with a relatively low lifting height. It mainly consists of components such as the oil chamber, oil pump, oil storage chamber, piston, rocker handle and oil valve. During operation, by reciprocating the rocker handle, the manual oil pump continuously pumps oil into the oil cylinder. Due to the continuous increase of oil pressure in the oil cylinder, the piston and the heavy object on it are forced to move upward together. When the oil return valve is opened, the high-pressure oil in the oil cylinder will flow back to the oil storage chamber, and then the heavy object and the piston will fall together. It has the characteristics of compact structure, stable operation, large supporting force and self-locking.

The global Universal Hydraulic Jack market size was estimated at USD 864.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
