Universe simulation software is a specialized type of software application designed to model and replicate various aspects of the universe, from the formation and evolution of celestial bodies like stars, planets, and galaxies to the behavior of fundamental physical forces such as gravity, electromagnetism, and the strong and weak nuclear forces. These software applications use complex algorithms and mathematical models based on established theories in astronomy, astrophysics, and cosmology. They can simulate phenomena ranging from the birth of a star through the process of nuclear fusion to the eventual collapse or explosion of massive stars as supernovae. Some universe simulation software also incorporates the interactions between different celestial objects, the distribution of matter and energy in the universe over time, and the effects of cosmic events on the surrounding space. By inputting different parameters and initial conditions, scientists, researchers, and even enthusiasts can observe and analyze how the universe might behave under various scenarios, helping to deepen our understanding of the cosmos and test theoretical hypotheses.

The global Universe Simulation Software market size was estimated at USD 249.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
