### Report Overview

Air to air refueling which is also called aerial refueling is considered as a major air power force multiplier. Air to air refueling is an effective method of increasing the endurance, payload, and range of the aircraft by refueling the aircraft during flight. The aircraft which transfers the fuel is called the tanker whereas the aircraft which gets the fuel is called the receiver. The two main refueling systems are probe-and-drogue, which is simpler to adapt to existing aircraft, and the flying boom, which offers faster fuel transfer. Flying with less fuel and refueling in the air is more energy efficient. It is estimated that air to air refueling saves 35 to 45% in fuel costs. Air to air refueling system is categorized into manned air to refueling and unmanned air to air refueling. This report focus on Unmanned Air to Air Refueling market.
