Report Overview

An unplated through hole prototype board is a type of circuit board used for electronic prototype development and testing. It is a prototype board with through-hole and hole structures on the substrate, usually without metal plating.

Features of the unplated through-hole holed prototype board include:

Through hole structure: The prototype board has a series of through holes, which are used to mount and connect electronic components, such as resistors, capacitors, integrated circuits, etc. Vias allow electronic components to make electrical connections between different layers.

Hole structure: The hole structure on the prototype board is usually for the convenience of installing and fixing the prototype board, such as studs, threaded holes or other accessories.

No Metal Plating: Unlike conventional circuit boards, unplated through-hole prototype boards typically have no metal plating on the through-holes and through-holes. This means that vias and vias on the board are not conductive and need to be electrically connected by other means.

Unplated through hole prototype boards are often used in electronics prototyping and rapid testing phases. They provide a convenient platform for engineers to quickly prototype circuits, perform functional verification, and debug. Because there is no metal

plating, these prototype boards usually do not have the requirements for high-frequency signal or high-current applications, but are more suitable for low-frequency, low-power circuit design and testing.
