Abstracts

Unshielded patch panels are networking components used to organize and manage cables in structured cabling systems. They are typically used in Ethernet networks to connect and route data between various devices. These panels consist of a series of ports where cables can be inserted and connected, and are often used in environments that do not require additional protection against electromagnetic interference (EMI) or radio frequency interference (RFI). In an unshielded patch panel, the cables are usually unshielded twisted pair (UTP) cables, meaning they lack any additional layer of shielding to protect the data signals from external interference. These panels are often more cost-effective than their shielded counterparts and are commonly used in environments where EMI or RFI is not a significant concern.

The global Unshielded Patch Panels market size was estimated at USD 859.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
