Report Overview

The Upper Humeral Joint Prosthesis is a medical device designed to replace the damaged or diseased humeral head in the shoulder joint. It consists of a metal stem that is inserted into the humerus bone, a metal or ceramic ball that acts as the new humeral head, and sometimes a plastic socket that is placed in the shoulder blade to create a new joint. This prosthetic device aims to restore mobility, reduce pain, and improve the overall function of the shoulder joint for individuals suffering from conditions such as arthritis, fractures, or rotator cuff tears. The market for Upper Humeral Joint Prosthesis is driven by the increasing prevalence of shoulder-related disorders, the growing aging population, and advancements in surgical techniques and materials used in prosthetic devices.
