Report Overview

In uPVC windows, a plastic powder called uPVC (unplasticized polyvinyl chloride) is used to make the frames for windows. Firstly, uPVC is heated to a certain temperature, and it is ordered into shape by being injected into a mold. After it has been injected into a mold, several cooling methods are applied to it. Once cooled, uPVC is cut and prepared along with other components to be assembled in the window. Since uPVC is an unplasticized material – meaning no chemicals called plasticizers have been added to it – it hasn't been softened and retains its strength. Due to this, uPVC windows are highly durable and possess multipurpose functionalities.

The global uPVC Windows market size was estimated at USD 15100 million in 2023 and is projected to reach USD 22056.46 million by 2032, exhibiting a CAGR of 4.30% during the forecast period.
