Report Overview

In uPVC windows, a plastic powder called uPVC (unplasticized polyvinyl chloride) is used to make the frames for windows. Firstly, uPVC is heated to a certain temperature, and it is ordered into shape by being injected into a mold. After it has been injected into a mold, several cooling methods are applied to it. Once cooled, uPVC is cut and prepared along with other components to be assembled in the window. Since uPVC is an unplasticized material – meaning no chemicals called plasticizers have been added to it – it hasn't been softened and retains its strength. Due to this, uPVC windows are highly durable and possess multipurpose functionalities.
