Report Overview

Uranium is a naturally occurring, radioactive heavy metal element (atomic number 92) primarily used as a fuel in nuclear power generation. It exists in several isotopic forms, with U-238 and U-235 being the most significant. U-235 is fissile, meaning it can sustain a chain reaction when bombarded with neutrons, releasing large amounts of energy?making it the core material in nuclear reactors and nuclear weapons. In its raw form, uranium is mined as ore (commonly uraninite or pitchblende) and then processed through several stages?milling, conversion, enrichment, and fuel fabrication?to produce nuclear fuel suitable for use in power reactors. Uranium is critical to global energy security and decarbonization efforts, as nuclear energy remains one of the most reliable low-carbon power sources.

The global Uranium market size was estimated at USD XX million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of XX% during the forecast period.
