Abstracts

Ureido silanes are bifunctional organosilicon compounds that feature a reactive ureido group and a hydrolyzable alkoxy silane group within their molecular structure. This unique composition enables them to function as adhesion promoters and surface modifiers, facilitating chemical bonds between inorganic materials (such as glass, metals, and fillers) and organic polymers (including thermosets, thermoplastics, and elastomers). Compared to amino silanes, ureido-functional silanes offer enhanced stability in reactive polymer systems like phenolic, epoxy, urea-melamine, or polyurethane resins. They do not discolor over time and provide nitrogen reactivity without the strong basic characteristics typical of amino silanes. Additionally, ureido silanes improve adhesion to oily metals, making them valuable in applications requiring robust bonding under challenging conditions.

The global Ureido Silane market size was estimated at USD 127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
