Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Urethane Acrylate Oligomer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A urethane acrylate oligomer is a multifunctional prepolymer widely used in radiation-curable formulations such as UV- and EB-curable coatings, adhesives, and inks. It is synthesized through the reaction of diisocyanates, polyols, and hydroxy acrylates, forming a molecular structure that combines the toughness and flexibility of urethane linkages with the fast-curing reactivity of acrylate groups. When exposed to ultraviolet or electron beam radiation, the acrylate groups rapidly polymerize to form a crosslinked film, providing excellent hardness, adhesion, and chemical resistance. This balance of mechanical durability and quick curing makes urethane acrylate oligomers a core material in high-performance surface finishing and protective coatings. In 2024, global urethane acrylate oligomer production reached approximately 126.40 k tons, with an average global market price of around US\$ 3663 per ton. And global urethane acrylate oligomer production capacity reached approximately 150 k tons. The average gross margin in this industry reached 46.57%. Upstream: The urethane acrylate oligomer industry relies on key upstream raw materials such as polyols, diisocyanates (e.g., TDI, HDI, IPDI), acrylate monomers, and catalysts. These feedstocks are primarily derived from petrochemical processes. Production involves urethane prepolymer synthesis followed by acrylation reactions under controlled temperature and catalyst conditions to achieve specific molecular weights and functionality. Representative upstream suppliers include BASF (polyols and diisocyanates), Covestro (aliphatic isocyanates), and Arkema (acrylate monomers). Upstream innovation focuses on bio-based feedstocks, low-viscosity oligomer design, and reduced volatile organic compound (VOC) content to meet environmental regulations and improve process efficiency. Downstream: Urethane

acrylate oligomers are widely used in UV-curable coatings, inks, adhesives, and 3D printing resins, offering high hardness, flexibility, and chemical resistance. They are essential in industries such as electronics, automotive, packaging, and furniture finishing. Representative downstream companies include Allnex (radiation-curable resins), Sartomer (specialty oligomers), and Dymax (UV-curable materials). With the rapid growth of UV/EB curing technologies, downstream demand is shifting toward high-performance oligomers with tailored crosslinking density, faster curing speed, and improved weatherability to support sustainable and energy-efficient surface finishing applications.

The global Urethane Acrylate Oligomer market size was estimated at USD 463.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
