Abstracts

Urethral bulking systems are minimally invasive medical devices used to treat stress urinary incontinence (SUI) by injecting biocompatible materials, such as synthetic polymers or hydrogels, into the urethral wall to increase tissue bulk and improve coaptation, thereby restoring continence. These systems typically consist of a delivery device?such as a specialized syringe or injection gun?and the bulking agent itself, designed for precise, controlled placement under cystoscopic guidance. The procedure is often favored for patients seeking a less invasive alternative to sling surgeries or those with comorbidities that preclude more extensive operations, offering the benefits of shorter recovery times and reduced surgical risk, though durability of results can vary based on the product and patient factors.

The global Urethral Bulking System market size was estimated at USD 225.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
