Abstracts

Male External Catheters, also commonly referred to as condom catheters or male catheters, are used by men to treat urinary incontinence. A significant driver in the Urinary External Catheter market is the increasing awareness of catheter-associated complications and the need for more comfortable and less invasive urinary management solutions. Urinary external catheters, often made of silicone or latex, provide a convenient and less intrusive option for individuals with urinary incontinence or retention. However, a notable challenge in this market is the need for patient comfort and skin integrity. Ensuring that external catheters are designed to minimize skin irritation, maintain secure attachment, and offer reliable performance while addressing potential challenges related to allergies or discomfort poses a significant challenge.
