### Report Overview:

Urinary incontinence is the involuntary loss of urine due to a loss of bladder control. Millions of people across the world are affected by urinary incontinence, and women are more likely to be affected than men. Urinary incontinence is highly underreported, primarily due to embarrassment to speak about it. Several factors such as urinary tract infection, weakening of the pelvic floor muscles and urethral sphincters, menopause, pregnancy and childbirth, and post radical prostatectomy surgery in men lead to the development of urinary incontinence. Electrical stimulation devices have been in use for more than 20 years for the effective management of urinary incontinence where all other treatments have failed to control symptoms of the condition.
