## Abstracts

A urinary incontinence sling is a medical device used to treat stress urinary incontinence (SUI), a condition where involuntary leakage of urine occurs due to activities that put pressure on the bladder, such as coughing, sneezing, or exercising. The sling, typically made of synthetic mesh or sometimes biological material, is surgically implanted beneath the urethra to provide support and prevent it from dropping during activities that increase abdominal pressure. This support helps maintain proper urethral closure, thereby reducing or eliminating urine leakage. The procedure to insert the sling is minimally invasive and is commonly performed on women who suffer from SUI, particularly when conservative treatments like pelvic floor exercises or lifestyle changes have not been effective. Urinary incontinence slings have a high success rate and are a widely used solution for managing SUI.

The global Urinary Incontinence Sling market size was estimated at USD 665.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
