## Abstracts

Usage-based billing software is a system that charges customers based on their actual usage of a service or product. Customers only pay for what they use rather than a flat fee. This software integrates with various systems to collect usage data as per user activity and works on a usage-based pricing model. It processes this data to calculate charges based on predefined metrics, like data volume, transaction counts, or service hours, and associated unit costs. This often involves real-time monitoring using a metering engine and an automated invoicing system. Usage-based billing software is used in various industries and scenarios where charges are based on the actual usage of services. Some of the common use cases are found in telecommunications, utilities, cloud services, software as a service (SaaS), internet of things (IoT) industries, etc. The usage-based billing software market is growing rapidly and becoming increasingly segmented. Enterprises and public institutions are increasingly favoring flexible models such as pay-as-you-go, pay-per-fee, and pay-per-user/instance, as well as event-driven elastic scaling, particularly in cloud-native, SaaS, and microservice architectures. The market is focused on stringent requirements for high availability, transparent pricing, on-demand scaling, hybrid monthly/annual plans, and billing accuracy, compliance, and data security, while simultaneously driving improvements in usage monitoring, usage forecasting, and automated billing capabilities. Industries are increasingly demanding elastic billing, subscription management, subscription changes, and integration with financial systems; competitive advantages lie in cost control, speed of implementation, and seamless cross-system integration.

The global Usage-Based Billing Software market size was estimated at USD 217.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
