Abstracts

USB Data Blocker is a tool used to prevent USB devices from transmitting data while charging, thereby protecting the device and data security. Through hardware design, the data transmission pins are disconnected or physically isolated inside the USB interface, leaving only the power pins (VCC and GND) for charging. When a device is connected to a power source through a USB data blocker, only charging operations can be performed, and the data transmission function is cut off, thereby preventing external devices from stealing data, installing malware, and other operations on connected devices through the USB interface.

The global USB Data Blocker market size was estimated at USD 124.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
