Abstracts

A USB load cell is a type of sensor that measures force or weight and connects to a computer or other device via a USB interface. Most USB load cells are based on the principle of strain gauges. When a force is applied to the load cell, it causes a deformation in a sensing element. This deformation changes the electrical resistance of the strain gauges attached to the element. By measuring this change in resistance, the load cell can determine the magnitude of the applied force. The electrical signal from the strain gauges is converted into a digital signal and sent to the connected device via the USB interface for processing and display.

The global USB Load Cell market size was estimated at USD 271.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
