## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on USB4 Dock competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of USB4 dock was 5.618 million units, with an average price of US\$191 per unit. A USB4 dock is a docking station that uses the USB4 standard to connect a laptop to multiple devices like monitors, peripherals, and storage through a single USB-C port. It offers high-speed data transfer (up to 40Gbps), which is eight times faster than previous USB 3.0 standards, and can also charge the connected laptop. This allows for a streamlined, clutter-free workspace with enhanced connectivity. The upstream supply chain of USB4 dock mainly consists of USB4 controller chips, protocol-compatible chips, PD3.1 fast charging power modules, high-speed signal transceivers, precision high-speed PCBs, high-speed cable assemblies, aluminum alloy casings, and heat dissipation components. Among these, the USB4 controller and high-speed retimer are key components determining product bandwidth and compatibility, with global supply still dominated by European, American, and a few Asian chip manufacturers. Downstream applications are concentrated in mobile office, multi-screen expansion for thin and light laptops, content creation, video conferencing and remote education, enterprise workstation deployment, and high-speed peripheral connections for scientific research and engineering. Enterprise IT demand is growing the fastest, relying on USB4 docking stations to improve desktop uniformity and reduce laptop interface limitations, while content creators rely on them to achieve 4K multi-screen output and high-speed storage array connections. With thin and light laptops increasingly reducing traditional interfaces, docking stations have become standard peripherals for laptop users. The industry is showing trends of bandwidth upgrades, unified interface standards, breakthroughs in domestically produced high-speed chips,

and the integration of multi-port high-power power supplies. USB4's 40Gbps bandwidth and compatibility with the Thunderbolt ecosystem are driving the expansion of docking stations towards high-resolution multi-screen displays, high-speed external SSDs, and virtual reality development. Driving factors include increased demand in professional creative scenarios, higher penetration rates of hybrid office environments in enterprises, widespread adoption of 4K/6K monitors, growth in external high-speed storage, and increased reliance on single-wire connections for mobile work. Obstacles include limited supply of USB4 controllers and retimers leading to price fluctuations; high system design complexity resulting in high R&D and verification costs; stringent heat dissipation and EMI requirements leading to high defect rates; and inconsistent USB4 compatibility performance in some laptops affecting user experience. The lack of a unified certification system also slows down market entry for some manufacturers. Single-line annual production capacity is between 300,000 and 600,000 units, with a gross profit margin of approximately 18%?25%.

The global USB4 Dock market size was estimated at USD 1073.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
