Abstracts

Uterine biopsy forceps are specialized medical instruments designed for the collection of tissue samples from the endometrium, the inner lining of the uterus, typically used in diagnostic procedures such as endometrial biopsy to detect abnormalities, including hyperplasia, polyps, or malignancies. These devices are characterized by their slender, often flexible or rigid design, allowing for transcervical insertion with minimal discomfort, and feature a grasping or cutting mechanism at the distal end to securely obtain tissue specimens for histopathological analysis. They play a critical role in gynecological healthcare by enabling minimally invasive sampling, which aids in early diagnosis and treatment planning for conditions affecting the uterine cavity.

The global Uterine Biopsy Forceps market size was estimated at USD 245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
