### Report Overview

Uterine fibroid embolization (UFE) is an effective, non-surgical method used to treat uterine fibroids in the fertile women population. It is performed with the help of uterine fibroid embolization agents, delivered to the tumor by micro-catheters. The embolization agents block the arteries supplying blood to the tumor and force them to shrink.

The increased awareness about the uterine fibroids amongst women and popularity of minimally invasive procedure will drive the global market for uterine fibroid embolization agents.
