Abstracts

Uterine sarcoma treatment refers to the therapeutic interventions and medical approaches used to manage a rare and aggressive group of malignancies arising from the mesenchymal tissues of the uterus, including leiomyosarcoma, endometrial stromal sarcoma, and undifferentiated uterine sarcoma. Treatment typically involves a multimodal strategy centered on surgical resection, often via total hysterectomy with bilateral salpingo-oophorectomy, complemented by adjuvant or neoadjuvant therapies such as radiation, chemotherapy (commonly using doxorubicin, ifosfamide, or gemcitabine-based regimens), and increasingly, targeted therapies or immunotherapy for advanced or recurrent cases. Due to the heterogeneity and rarity of these tumors, treatment plans are highly individualized, relying on histologic subtype, tumor grade, stage, and molecular profiling, with ongoing clinical trials exploring novel agents like PARP inhibitors and immune checkpoint inhibitors to improve outcomes for this challenging disease.

The global Uterine Sarcoma Treatment market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
