Report Overview

The term 'ultrasound treatment' is a known one, while some of us may even have undergone some kind of check-up with its assistance. As the name suggests, a Doppler Ultrasound test uses higher frequency sound waves to measure blood flow in the arteries and veins and is usually done on the arms and legs. It is a completely risk and pain free procedure as it only involves using high intensity sound waves. It is recommended by doctors to check for signs of deep vein thrombosis, superficial thrombophlebitis, arteriosclerosis or even if tumours are suspected in any of the limbs. The ultrasound Doppler market can broadly be classified into two main types based on portability- handheld and trolley based ones.

An aging population in the western world while continue to ensure that both North America and Europe remain among the largest ultrasound Doppler markets. They benefit from world-class infrastructure, many healthcare benefits provided by the governments and also increasing adoption of home and remote patient monitoring to cater to their privacy concerns. They will drive the demand for compact, handheld devices in the medium to long term. Asia Pacific on the other hand, is expected to demand for greater trolley based ultrasound devices due to a proliferation of hospitals in underdiagnosed rural areas of these populous and fast growing countries. There have also been an increasing number of lifestyle-related health issues, especially in the polluted metropolis cities of China and India. Greater public awareness of benefits offered by the ultrasound treatments along with a special focus of global players on this highly dynamic region ensures thriving demand for the ultrasound Doppler market here as well.
