The ultraviolet analyzer is the application of fluorescence technology. After the substance molecules in the ground state are irradiated with excitation light (ie ultraviolet rays), the energy of excitation is absorbed, and the substance molecules are in the excited state. Part of the energy of the excited molecule is consumed by vibration, so the molecule is at the vibration level. When the vibration level returns to the ground state, the excess energy is released in other forms, which is fluorescence, and different substances can emit fluorescence at different wavelengths. People can According to the fluorescence of different light colors and the intensity of fluorescence to judge how much different substances and contents, this is fluorescence analysis. Ultraviolet analytical instruments are widely used in the analysis and testing of biological, chemical, pharmaceutical, pharmaceutical, food and forensic identification departments.
