Abstracts

UV disinfection lamp is a special lighting device that mainly uses the ultraviolet C-band (UVC) to eliminate indoor bacteria and viruses. UVC ultraviolet radiation has extremely high energy and can damage the nucleic acids and proteins of bacteria and viruses, thereby preventing their reproduction and infection. Ultraviolet disinfection lamps usually shine on objects or surfaces that need to be disinfected, helping to remove bacteria, viruses, and other microorganisms indoors to ensure the hygiene of the home environment. The principle of ultraviolet disinfection and sterilization is to use high-energy ultraviolet light to break the DNA double helix chain, thereby achieving the inactivation of bacteria and viruses; The ultraviolet band can be divided into different bands: UVA, UVB, and UVC. UVC is the band with the shortest wavelength and the highest energy. In fact, the most effective for sterilization and disinfection is the UVC band, which is called deep ultraviolet. Compared to chemical sterilization and disinfection, the advantage of ultraviolet radiation is its high sterilization efficiency, which is usually completed within a few seconds and does not produce other chemical pollutants. UVC ultraviolet light has a wavelength of 200-280nm (nanometers), and shortwave ultraviolet light is absorbed by the ozone layer when passing through the Earth's surface stratosphere and cannot reach the Earth's surface. Short wave ultraviolet radiation can have an important effect on the human body, therefore, sufficient attention should be paid to it.
