Abstracts

Ultraviolet (UV) curing powder coating is a specialized coating technology that utilizes a combination of powder coating application methods and UV light to achieve rapid curing at low temperatures. Unlike conventional thermoset powder coatings that require high-temperature baking to initiate cross-linking, UV-curable powders remain stable until exposed to UV radiation, allowing them to be used on heat-sensitive substrates such as plastics, wood, and medium-density fiberboard (MDF). This process involves applying an electrostatically charged dry powder to a substrate, which is then melted using infrared or convection heating to form a smooth film before being cured almost instantaneously under UV light, resulting in a durable, high-quality finish with enhanced chemical and scratch resistance.

The global Uv Curing Powder Coating market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
