Abstracts

Ultraviolet (UV) curing screen protectors are advanced protective films for electronic device displays?primarily smartphones and tablets?which utilize a liquid adhesive formula that is applied directly to the screen and then hardened through exposure to UV light. Unlike traditional tempered glass or PET film protectors, which rely on pre-applied adhesive layers or static cling, UV-curing variants form a permanent, bubble-free, optically clear bond with the display surface by filling microscopic imperfections and curves, resulting in superior edge-to-edge adhesion, enhanced impact resistance, reduced fingerprint retention, and a seamless appearance that mimics the feel of the original screen. This technology is particularly effective for devices with curved or highly contoured displays, where conventional protectors often struggle with fit and durability.

The global Uv Curing Screen Protector market size was estimated at USD 365.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
